Final Website Proposal

For my final website, I plan to build off my midterm, which was about sunscreen. I do plan to keep the basic layout (Using flex to position the nav bar vertically and grid for the layout). I want to play around with the nav bar, maybe change the style of the buttons. Style-wise, I want to keep the minimal aesthetic and existing colors that represent sunscreen. If I add more divs and want new colors, I will start with the same colors but change the saturation so everything stays cohesive. For my CSS animation, I want to keep it but place it on my types page, where I discuss the types of sunscreen. The viewer can purchase the best sunscreen for themselves using the animation after learning which is best for them, using the information on the same page. For my Javascript animation, I'm thinking of a dark mode toggle. So when you toggle it, the website will still be functional but with darker colors. I would like to apply this to all the pages so when the viewer toggles it, all pages go into "dark mode". For my JQuery interaction, I want to provide a "Frequently Asked Questions" section on my home page that slides in and out when clicked on. Either on the side of the page or directly under the last div. As simple as sunscreen seems, people have many questions about its use and ability, so it could be useful. For my p5.js animation, I want to add a sun emoji as the mouse. When the mouse moves up, the brightness of the page goes up, and when the mouse is moved down, the brightness dims. I would like to add a button in the upper corner that turns the interaction off, so the page remains normal regardless of where the mouse is. This would be on one page only, as I feel like it could ruin the vibe and aesthetic of the website if applied to all pages. All of these elements highlight the sun and emphasize its brightness. The "cloudiness" and dimness effect also highlight how sunscreen should be used at all times.
